## SUMMARY

This report presents results in satellite position and velocity accuracy as a function of tracking data, number of passes, station latitude separation, and other pertinent variables in graphical form. The information in this report, which is to be used as a design tradeoff handbook for error propagation in orbit determination, was obtained by using the Co-Variance (Fixed Bias) Simulator Program and a detailed list of AFSSD-supplied tradeoff parameters.

Volume IV is an extension of Volume I (125 nmi orbit, overhead pass) with tracked passes made through  $120^{\circ}$ ,  $90^{\circ}$ , and  $60^{\circ}$  of azimuth.

Paragraph 1 contains general introductory material to the report.

Paragraph 2 discusses the parameter cases which were used for this study.

Paragraph 3 describes the information and notations presented on the graphs.

Paragraph 4 comments on the assumptions of the Co-Variance (Fixed-Bias) Program.

Tabular information concerning sensor errors appears preceding the Appendix Section I graphs and Appendix Section II graphs.

THIS UNCLASSIFIED ABSTRACT IS DESIGNED FOR RETENTION IN A STANDARD 3-BY-5 CARD-SIZE FILE, IF DESIRED. WHERE THE ABSTRACT COVERS MORE THAN ONE SIDE OF THE CARD, THE ENTIRE RECTANGLE MAY BE CUT OUT AND FOLDED AT THE DOTTED CENTER LINE. (IF THE ABSTRACT IS CLASSIFIED, HOWEVER, IT MUST NOT BE REMOVED FROM THE DOCUMENT IN WHICH IT IS INCLUDED.)

FOREWORD

This Technical Documentary Report has been prepared in accordance with Exhibit "D" to Letter Contract AF04(695)-278 and Paragraph 4.2.2 of AFBM Exhibit 58-1, "Contractor Reports Exhibit", dated 1 October 1959, as revised and amended.

This report was prepared by Philco Western Development Laboratories in fulfilling the requirements of Paragraph 8.0 of Exhibit "B", Work Statement to Contract AF04(695)-278.

SPECIAL PARAMETER  
TRACKING SIMULATION STUDY  
LOW ALTITUDE SATELLITE

## 1. GENERAL

This report was prepared by the Mathematical Analysis Department of Philco WDL by using the Co-Variance, Fixed-Bias Simulator Program. It is to be used as a design tradeoff handbook for error propagation in orbit determination. This report presents, in graphical form, the results and trends in satellite position accuracy as a function of tracking data error magnitudes, different combinations of tracking data, number of passes, station separation, and other pertinent variables.

Volume IV contains additional results for the 125 nmi circular polar orbit. The passes, however, are not overhead and the effects of both fixed and random errors are included.

## 2. PARAMETER CASES

In the set of parameter cases considered in this report, the tracking configurations and sensor accuracies listed in Table I were used. The following combinations were run:

a. Sensors "a" and "b" in all cases (i.e., A-1 through C-3 for Sections I and II, with all combinations of sensor accuracies except a range error of 1000 feet and an azimuth and elevation error of 0.25 milliradian).

b. One sample per 4 seconds was assumed in all orbits.

c. All data within  $5^\circ$  of the horizon was used. The passes were through  $120^\circ$ ,  $90^\circ$ , or  $60^\circ$  of azimuth.

d. For fixed error only, the 1000-foot error in range and 0.25-milliradian error in angles was used separately in sensor case "a" and with 0.1 foot per second error in range rate in sensor case "b".

TABLE I. CONFIGURATIONS AND SENSOR ACCURACIES

CONFIGURATION	
A: Passes through 120° of azimuth (17.2° maximum elevation angle)	
1: one station	one pass (69 data points)
2: two stations with 45° latitude separation	one pass each station (138 data points)
3: two stations with 90° latitude separation	one pass each station (138 data points)
B: Passes through 90° of azimuth (10.5° maximum elevation angle)	
1: one station	one pass (57 data points)
2: two stations with 45° latitude separation	one pass each station (114 data points)
3: two stations with 90° latitude separation	one pass each station (114 data points)
C: Passes through 60° of azimuth (7.1° maximum elevation angle)	
1: one station	one pass (42 data points)
2: two stations with 45° latitude separation	one pass each station ( 84 data points)
3: two stations with 90° latitude separation	one pass each station ( 84 data points)
Orbit Case I: Fixed Error	
Orbit Case II: Random Error	
SENSOR ACCURACIES	
Sensor Case "a"	R, $\theta$ , $\phi$
Sensor Case "b"	R, $\dot{R}$ , $\theta$ , $\phi$
Angle accuracies	0.25, 1 milliradian
Range accuracies	50, 300, 1000 feet
Range-rate accuracies	0.1, 1 foot/second

Outputs of the above simulations are plots of in-track, altitude, and cross-track position and velocity errors versus time through one revolution from the last sighting. The plots have the last sighting on a common axis for ready cross-comparison.

### 3. DESCRIPTION OF GRAPHS

For fixed bias, each graph consists of the errors in the orbit's Frenet trihedron coordinates plotted against time. For covariance, each graph consists of the standard deviations of the orbit's Frenet trihedron coordinates (X,Y,Z) plotted against time. The Frenet trihedron coordinates (X,Y,Z) are the set of local coordinates in the orbital plane and normal to it with the origin in the satellite's position and with the following directions:

X is in the direction of the velocity vector,

Y is orthogonal to the left (directed counterclockwise through  $1/2$  in the orbital plane, and

Z is perpendicular to (X,Y) by the righthand rule.

Then, for a circular orbit:

$\sigma_x$  or  $\Delta_x$  is the in-track error,

$\sigma_y$  or  $\Delta_y$  is the altitude error, and

$\sigma_z$  or  $\Delta_z$  is the cross-track error.

Further,  $\sigma_{\dot{x}}$  or  $\Delta_{\dot{x}}$ ,  $\sigma_{\dot{y}}$  or  $\Delta_{\dot{y}}$ , and  $\sigma_{\dot{z}}$  or  $\Delta_{\dot{z}}$  are the errors in  $\dot{X}$ ,  $\dot{Y}$ , and  $\dot{Z}$  respectively. If  $\sigma$ 's are used, random errors are being discussed; if  $\Delta$ 's are used, fixed-bias errors are being discussed. Sensor error tables for fixed-bias error cases and covariance error cases are given at the beginning of Appendix Sections I and II.

#### 4. CO-VARIANCE, FIXED-BIAS PROGRAM ASSUMPTIONS

The graphs in Appendix Sections I and II were obtained from the Co-Variance, Fixed-Bias Program. The method assumes that the error propagation is linear.

APPENDIX SECTION I  
FIXED BIAS ERROR

SECTION I  
FIXED BIAS ERROR

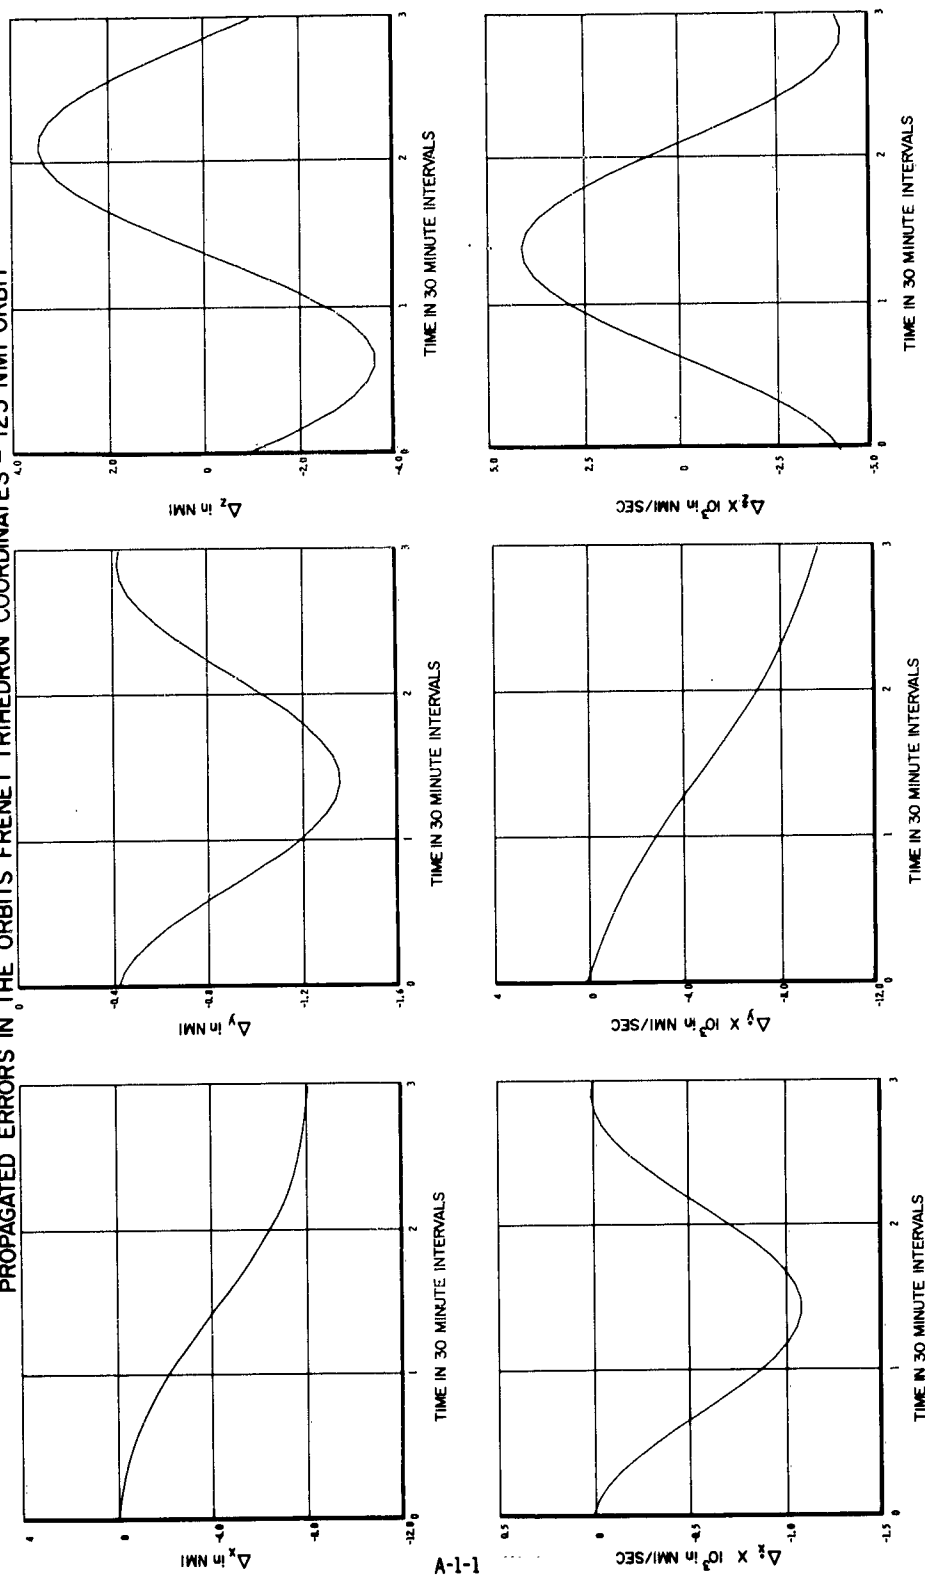

TABLE II. SENSOR ERRORS FOR FIXED BIAS ERROR

CASE NUMBER	RANGE AND ANGLE SENSORS	
	RANGE (ft.)	AZ AND EL. (mr)

 Sensor Error: 50 ft, 1 Milliradian (Random Error)  
 Tracking Through 90° of Azimuth  
 Tracking From 2 Stations (45° Latitude Separation)

A line graph showing the oxygen uptake rate ( $\dot{V}_{O_2} \times 10^3$  in ml/min/sec) on the y-axis against time in 30-minute intervals on the x-axis. The y-axis has major ticks at 0, 0.06, 0.12, 0.18, and 0.24. The x-axis has major ticks at 0, 1, and 2. The curve starts at (0,0), rises to a peak of approximately 0.22 at interval 0.5, then falls to a minimum of approximately 0.06 at interval 1.5, and finally rises to approximately 0.18 at interval 2.0.

**Sensor: Range and Angles**  
**Sensor Errors: 300 ft, 1 Milliradian (Random Error)**  
**Tracking Through 90° of Azimuth**  
**Tracking From 2 Stations: 45° Latitude Separation)**
